

Product Portfolio: NonStop AutoSYNC

Replicating your databases is a key step in ensuring business continuity and multisystem operations, but other things—including edit, object, source, and setup files—must be replicated in order to keep the system running. NonStop AutoSYNC addresses this need by watching all those non-database files and replicating them when anything changes.

In addition to the clear business continuity benefits, NonStop AutoSYNC plays an important role during system migration. Once the new system is installed, AutoSYNC can be configured to synchronize everything from the old system to the new system, and keep them in sync during system test and burn-in. This approach lessens the migration risk considerably.

- Provides scheduled or ad hoc replication of whole files, within or between NonStop server systems.
- Provides support for Guardian and OSS files and directories, as well as Expand or TCP/IP communications.
- Can be used for complete system migrations (all files, including databases) or as a complement to database replication products.
- Offers extensive reporting features that show the state of synchronization between two sets of files.
- Using the powerful TRIGGER capability, allows additional processing as the result of a file being replicated.
- HP provides worldwide distribution and support for AutoSYNC as part of its NonStop business continuity product suite. Contact your HP representative for product evaluation and pricing.
